

Udacity - Android Development For Beginners

Project Idea

Name: Thiago Rizuti.

Project Name: Sci5 - Science in five steps.

Target User: new science students .

The app purpose is to briefly present and teach to new science students how the scientific method works. The content is divided into **five** major topics:

1. **Question**, observation of phenomena and scientific question;
2. **Research**, background research on previous works;
3. **Hypothesis**, what is and how to formulate a good hypothesis;
4. **Experiment**, experiment design and variables;
5. **Conclusions**, data analysis, prove or disprove of hypothesis.

It is expected the app to be useful for the new students as a guide and quick reference while they begin to work with and design their research projects.

As a Computing Science student writing my graduation dissertation, I think that would be very handful for students to get familiar with the subject right on the beginning of their academic lives.
